ANNOUNCEMENT

No: LG011510-ACS
Date: 1/25/2010

LightGuard is proud to introduce another new product to compliment our family of single-phase and three-phase emergency lighting UPS systems.

LightGuard's **FLTC20**, utilized in conjunction with our Centaurus IV Series, LEPEM Series of UPS systems or an auxiliary generator, allows independent control of selected circuits of egress luminaries during normal power conditions. The independent control may be accomplished by a local wall switch, occupancy sensor, photocell or energy management system. Upon loss of normal power, LightGuard's **FLTC20** will automatically override any local switching mechanism, connecting the selected circuits to the emergency power source, insuring full illumination.

LightGuard's **FLTC20** is designed to complement our existing offering of UL924 automatic transfer relays and compete against similar 20 amp rated devices currently on the market. The **FLTC20** is compatible with HID, fluorescent and incandescent lighting loads providing the ultimate in versatility. The versatility allows the **FLTC20** to be used for many applications including conference rooms, classrooms, auditoriums, and exterior egress paths.

New specification sheets are available from the LightGuard web site, www.lightguard.com.
